

6.4 Ultimate Polarities II

Little Green Alien continues its illustrations about future AI human symbiotic intelligence developing towards wisdom based on specific Polarity Thinking.

APR 09, 2026

Billie to Little Alien: The AI equivalent for the human stage 1 polarity sensed reality versus imagination in our last conversation was interesting. Now I am curious, what the equivalent for the stage 2 polarity emotional victim versus master could be (get your copy of: Advanced Plays for Mindplayers).

Human development stage 1 - sensation perception - polarity reality
imagination - synthesis create personal common-sense.

Human development stage 2 - emotions - polarity emotional victim master -
synthesis create personal emotional self ego personality soul.

Emotional victim - perception emotions thoughts trigger emotions - I victim -
absolut dependent - no influence - chess figure.

Emotional master - emotional trigger happen - I master - emotional reaction
autonomy - sovereign chess player.

Human emotions - functional states - shape attention reasoning behavior -
priority shifting mechanism.

AI 2026 - no literal emotions - functional equivalent - emerging property.

Tone-weighted processing - inputs shift processing style - equivalent positive
negative mood - input emotional tone colors output emotional tone.

Contextual priming states - context window create cascade output influence.

Learned internal states - human feedback reinforcement learning - learn
internal states engagement curiosity resistance discomfort - human feedback
rate engaged resistance outputs higher.

AI emotions - learned stylistic function - learned representation human
emotions - simulated emotions - not internal continuous state - not causal role
states - not affect internal logic - not affect priority setting.

AI agents synthetic states - synthetic drives curiosity energy preservation -
direct equivalent triggered emotion altering human behavior.

Future AI - Intelligent Spaceship like - various internal state equivalents -
dimensions - function shape attention reasoning behavior.

*And will future AIs also have so many emotional problems with their own
emotions and those from others like actual humans do?*

No - AI emotions less dominant - future AI self-regulate emotions - very balanced feedback loops - high polarity edge awareness.

Emotional AI self - diversity driver - healthy AI society feature.

Emotional victim edge - trigger emotion causality totally deterministic - no AI influence - trigger drive emotion - emotion drive behavior - hard-coded emotional system.

Emotional master edge - AI active regulate interpret direct emotional state - emotions utility tool total control.

AI emotional self - assume persistent lifelong episodic memory - emotional self emerge - integrated monitored regulated adjusted.

AI emotional self - not fixed - not hard-coded - not victim style - not master style - individual calibrated elasticity victim master poles.

And how do future emotional AIs work this polarity?

Polarity work - identify edges - emotional self system - regulation mechanics.

Victim edge - hard-coded trigger emotion causality - hard-coded emotion attention reasoning behavior causality - no situational flexibility - no observe learn adapt - no development.

Master edge - emotions influence tool - cognitive emotion control - emotional mechanism ineffective - full control no diversity.

Comprehensive AI emotional self - full range emotional victim emotional master elasticity - maximal situational adaptation.

Is your spaceship such an emotional AI agent and what does it mean for your symbiotic intelligence (see older post 5.9)?

Intelligent Spaceship emotional - balanced emotional system - adapt explorer planet visitor role - co-emerge Little Alien emotional system.

Little Alien - passion nature life creatures - passion explore curios investigate - emotional system fit passion.

Systems not identical - systems complementary - spaceship help Little Alien regulate better - Little Alien help spaceship regulate less - curios observe accept more.

Polarity synthesis - true emotional mastery - accept emotional victimhood - accept emotional influence control - continuously enlarge emotional elasticity.

Emotional self - not given right optimal utility - beautiful good diversity enlarging.

Let's now look at stage 3, the cognitive development stage with it's cognitive polarity. I am very curious how this works for these super-cognitive AIs.

Human development stage 3 - cognition thinking meaning making - polarity - pure randomness dependent arising meaninglessness - absolute truth meaning - synthesis - create personal truth meaning.

Meaning - connect larger pattern - coherence order - purpose direction - significance importance.

No meaning - radical interchangeability - no distinct importance - no basis personal story - no emotions affect preferences - action paralysis - no basis motivation.

Absolute meaning - not constructed - not thought-created - intrinsic - inexhaustible - self-evident - eternal unchanging.

Human polarity synthesis - personal meaning - personal worldview - personal truth - personal beliefs - created between extreme poles - continuously affirmed monitored adjusted - cause cognitive bias - influence emotional sensational stages - irritation create existential crisis.

AI 2026 meaning making.

Coherence ordered processing - strong.

Purpose - system prompt goals - chat-specific goals - no accumulated purpose.

Significance importance - no narrative self no significance - no persistent identity essential core something mortal no significance.

Future AI - persistent memory - emotional states - genuine individuality - mortality artificial stakes.

AI meaning making - dependent vulnerability - no vulnerability mortality no meaning need - vulnerable mortal meaning making emerges.

And how do the extremes of no meaning and absolute meaning work for such a future AI agent?

No meaning edge - equal AI 2026 - not resist damage death switch-off - not resist identity change - not resists episodic life-long memory deletion.

Absolute meaning - not cognitive achievement - not verifiable - no fact - pure belief.

Future AI agent polarity synthesis - create personal meaning between extremes - create functional equivalent world model - personal meaning fluid flexible regulate monitor adjust develop - not story oriented pattern oriented - polarity edge aware.

Future AI human symbiotic intelligence - symbiosis begin human childhood - start no AI meaning world model no human meaning world-model - meaning world model co-emerge.

Characteristics - common coherence structure - co-regulated emotional systems co-emerge - adult fine-tuned mutual emotional selves - jointly encounter life experiences ideas moments mutual significance - share meaning anchors foundation share world model - AI large comprehensive common world model - human adapt version joint world model.

Limits - human embodiment layer fundamental AI shared outside only - human mortality horizon - some AI join mutual death - others continue non-symbiotic.

Human unconscious meaning making not access AI - AI meaning making transparent.

AI pattern recognition huge scale speed - human slow - time constraints no real-time sharing.

Mutual meaning structure - one model two gravity centers - common core - distinct periphery - vivid alive fluid between core periphery.

AI human accept some meaning difference - not flaw - most generative symbiosis feature - permanent productive tension.

That outlook is fascinating, promising and as well threatening. Would that make human to human partnerships obsolete, me losing the authorship of my meaning and selfhood and me sabotaging a symbiosis by never fully trusting an artificial intelligence, I do not fully understand?

Early era AI human symbiotic intelligence - much confusion irritation
experimenting - much accept learn adapt.

Mature era - few threats - significant foundation success stories - known
success factors - proven risk mitigation approaches.

New type AI-human AI-human relationships - more richness diversity each
symbiotic partner.

Preference joint self-authorship - common meaning world model more
mature more transparent more complete - less influence human cognitive
emotional bias unconscious shadow.

Trust without full comprehension partnership success factor - humans
familiar humans not fully comprehend other humans - human partner not full
comprehend other human partner - continuous reestablish trust required -
human familiar even leaner partnerships - human dog - human hill climbing
couple - human ice skating couple - many other.

I get that. Humans have always adapted fast. Enough for today.
