

Season 2, Sequel 11

Earth might become a Cosmic Intelligence Node.

These are the last two elements of the picture of the future that was presented by Little Alien and Billy in sequel 2.7.

Yeah, and they have seen this, and the intelligent spaceship is explaining what it means. It means that the intelligence will grow and grow and grow, until it builds a node, a node of planet Earth, located on the moon, because the biggest habitats will be there. And this node will be connected to other intelligences in the cosmos. We cannot understand how that communication goes, it is far beyond the capacity of the human intellect. But that is the end goal, as the intelligent spaceship is explaining.

And how can artificial intelligence of today get there? Artificial intelligences build agents and build hierarchies. So on a low level, as of today, even low-level agents can build higher-level agents. And on the middle level in the future, that will be the level of collaboration with humans, humans can communicate with that type of intelligences, and that may be adding value. And then these nodes will be part of a higher hierarchy, building higher hierarchies, and it's going up and up. We don't know how much it will go up. But it has to build diversity, it has to build complexity. And on these much higher levels you get intelligences that we cannot understand.

And that will just be that level of evolution, as much as a mouse cannot understand a human being. And the end point is the intelligent node that we see there, on the highest level of intelligence.

But what does it require? Yeah, we also saw the picture of the lotus flower, so beautiful. This is beautiful, like intelligence is beautiful. Just beautiful in the sun. But

what is beyond the surface of the water, and even lower? Yeah, there are the roots and the rhizome and then there is the center of it, that is making it all happen. For the lotus flower, no blossoming without that down there.

And if you cut it in some section, you see it has a structure that even looks a little bit like the symbol of AI. But where do the roots get their substances and energy from? Yeah, from dirt, from mud, from blood, from death, from all stuff that sunk down there and has rotted.

And that is exactly what AI will also need. It will need competition, competition about things, about money, about resources, about substances. Competition about territories, like humans do it and call it war. Competition about power: who is dominant, who is subordinate. Competition about attention: give me more likes or vote me for president. Competition about truth: my truth is not your truth, my truth is right, and if not, I fight you. Competition about longevity: I want to live long, longer, longer. Competition about the sunny side of life and the sunny places.

And all that is a substrate. But Billy is shocked, does it mean war? No, not necessarily. People have developed academic discourse, market competition, democracy, the Olympics. But will AIs do that? Yeah, probably.
