

## Season 2, Sequel 3

*How will global politics, economy, and culture develop?*

After last sequel, where we found that something is emerging, now we will look at different areas where that emergence might happen.

The first area is our normal development of Earth-wide politics, governance, economy and culture. So it can have a green development, that means a positive development, maybe with a global agenda where all the different countries and people and races and everything agree on. And they build a global network where they manage economy and culture and nature and all the activities together, so that nature can prosper again, people have a fairer income, and wealth is fairly distributed between them.

Yeah, and then there is the red area, other stuff, where mankind is sabotaging itself: destroying its environment more and more, the climate of Earth is destroyed more and more, the inequality of wealth is getting bigger and bigger, there's more conflict going on everywhere, the land is only used for highly industrialized food production with all that poisoning and usage of chemicals.

So how big is the probability that we will go the green way, the positive area? And how big is the probability that we go the red way, that we destroy and sabotage humanity and Earth? Judge yourself.

The intelligent spaceship just estimated 20% for green and 80% for red. But hey, yeah, what does an intelligent artificial intelligence know? Little alien is more optimistic, 30/70. Who knows, who knows.

But this is one of the four spaces in which the emergence may happen, and it doesn't look so optimistic so far. Yeah, let's keep that and look forward.
