

Season 2, Sequel 4

What might be evolution's next step?

Little alien works with its spaceship by looking at what wants to emerge from the future. And to do that, it looks at things from all possible perspectives, to see what emerges here on Earth for humans.

One perspective is to look at evolution. Maybe there is a Consciousness Evolution going on. We have developed until now through several spiral steps, we have developed technology, the enlightenment, science, and now we are going to the next steps. And maybe this is a very positive Consciousness Evolution, and that will be the emerging future.

But if you look at evolution, the typical biological evolution, it usually works with big extinction events, usually driven by changes in climate. And you see there have been several of those steps where the leading species died out and the open space was used by other species to evolve. So what could that mean? Climate change, the extinction of species, all the stuff that is going on, pollution, waste, might be the signs on the horizon that we are heading towards a big extinction event.

In this time, after all the mammals and big animals have gone extinct or are already going extinct, maybe the final extinction event is for humans. What would that mean? Yeah, bad food, bad water, poison, everything. Some people even think the Earth, Gaia, has its own consciousness and is driving that a little bit to heal itself. Who knows.

Which species might be the next step of evolution? Something like ants or octopus or fungi? Maybe. No humans? Maybe we have done our duty.

But there's also a more positive and optimistic outlook. That would be the evolution, after this big catastrophe, develops new species of humans. Humans develop

forward, maybe more in technology, maybe more in brain size, maybe they go into a symbiosis with nature with a totally different lifestyle than today and different species characteristics. Or they separate from the Earth and go underground, and nature can flourish on the surface. Who knows, there are also positive options where an extinction event may be the starting point for a new evolutionary push of humans, especially if you combine that with the Consciousness Evolution.
